OVERVIEW
Minnesota Perinatal Physicians, part of Allina Health, has a team of highly skilled surgeons who provide a center of excellence experience for every patient diagnosed with a morbidly adherent placenta. These high-risk patients are provided with a comprehensive and collaborative plan of care, and an experienced surgical team that is available 24/7. The program’s team along with the maternal-fetal medicine specialist includes critical care specialists, urologists and interventional radiologists with the capability to provide massive transfusion services if required.

The key to exceptional outcomes is early diagnosis and assessment of risk with delivery at an institution that has the capacity to manage this potentially life threatening condition.

The key to exceptional outcomes is early diagnosis and assessment of risk with delivery at an institution that has the capacity to manage this potentially life threatening condition.

The key to exceptional outcomes is early diagnosis and assessment of risk with delivery at an institution that has the capacity to manage this potentially life threatening condition.
Patients at higher risk include:

- history of cesarean delivery
- IVF pregnancy
- prior hysteroscopic surgery
- prior pelvic irradiation
- rudimentary horn with no connection to the uterus

History of cesarean section in the presence of a placenta previa increases your risk for an abnormally adherent placenta.

It is recommended that a patient with historical risk factors be seen early in pregnancy for an ultrasound evaluation.

Please see above for additional details.
